

Vulnerability Assessment Report

Project	AI-VAPT (Automated Vulnerability Assessment & Reporting Tool)
Prepared By	Sujan Gowda
Target	8.8.8.8
Resolved IP	8.8.8.8
Tools Used	Nmap, Curl, Nuclei, Playwright, ReportLab, Ollama(AI)
Generated On	2026-02-09 12:09:07

High-Level Recommendations

- Patch and update exposed services where possible.
- Restrict unnecessary open ports using firewall rules.
- Use HTTPS and enable strong security headers.
- Validate findings manually before remediation decisions.

AI Executive Summary (Ollama)

Here is a short executive summary and recommendations:

****Executive Summary:****

Our vulnerability assessment and penetration test (VAPT) report for the target IP address 8.8.8.8 has concluded with no critical or high-severity findings detected. The DNS server at 8.8.8.8 was found to be running on ports 53/tcp and 443/tcp, but a thorough scan revealed no vulnerabilities.

****Recommendations:****

1. Review system logs to identify potential security incidents.
2. Ensure timely updates for DNS software and firmware.
3. Implement additional logging and monitoring to detect suspicious activity.
4. Consider configuring rate limiting or CAPTCHA to prevent brute-force attacks on DNS services.

Please note that this report is an automated VAPT, and a human assessment would be recommended for more comprehensive results.

Network Scan Summary (Nmap)

Port	State
53/tcp	open
443/tcp	open

Web Targets Detected
